(54) Title: CAP FOR DRINKING CUP HAVING OUTLET VALVE

(57) Abstract

A drinking device (20) adapted for use by young children includes a cap (21) adapted to sealingly cover a drinking cup (22). The cap has a spout (23) and a mount (24), and a valve cartridge (25) removably attached to the mount for controlling fluid flow through the spout. The valve cartridge is removable for easy cleaning or replacement, and includes a valve holder (26) that manually, frictionally pressfits into a barrel-shaped mounting flange (44) on the cap. The valve holder includes a grip (47) to facilitate removal of the valve cartridge from the cap. A valve retainer (28) snap-attaches to the valve holder (26) to hold a silicon rubber valve in place on the valve holder. The valve includes a head section (29) with slits that define cooperating valve fingers (30) that cooperate to selectively allow fluid to flow out of the spout or to allow air to flow back into the cup, thus allowing the valve to operate as a single and only valve on the drinking cup.

CAP FOR DRINKING CUP HAVING OUTLET VALVE

BACKGROUND OF THE INVENTION

The present invention concerns drinking cups, and more particularly concerns a cap having a valve for controlling fluid flow from and back into a drinking cup.

5 Drinking cups for young children often include a cap with an apertured spout and a valve to prevent fluid from being spilled. However, traditional valved youth drinking cups are difficult and/or time consuming to clean such that the valve can potentially become unsanitary and/or not fully functional. This problem is compounded by the fact that some mothers forget or are too busy to spend the time necessary to thoroughly clean
10 the valve, or do not realize how important a thorough cleaning is. Another problem is that, in many existing cups having valves, it is difficult to tell if or when their valve(s) is properly cleaned, particularly when the valve is positioned inside of a concave region in their cap where it is difficult to see and reach. There are also numerous additional functional requirements that are difficult to achieve simultaneously. For example, the
15 valve must be fast acting in order to prevent spillage, yet must allow fluid to flow easily out the spout to a young child using the drinking cup. Also, the drinking cup must reliably prevent leakage, yet must also operate equally well at multiple angles. Also, it is preferable that the valve allow fluid still in the spout to redrain back into the drinking cup so that small spills do not occur. In the cost competitive industry of products for young
20 children, the drinking cup must be mechanically non-complex with a minimum number of pieces to minimize cost. Where the cap and valve can be disassembled, the loose pieces must be large enough to prevent them from being lost and to allow easy reassembly, yet must fit into and operate in the relatively small interior of a cup sized for a young user. Further, the reassembly procedure must be apparent from the parts themselves.

25 Some known drinking cups have a cap that includes a first valve to control fluid flow out of the spout, and a second valve to control air flow into the drinking cup. However, this valving arrangement increases the number of pieces, doubles the sanitation and misfunction problems, and adds significant expense to the product. Another problem is that these known valving arrangements do not work properly if either of the valves
30 becomes plugged or partially inoperative, which is more likely to occur with two valves than with a single valve.

 Silicon rubber valves are known that can be used for dispensing food in a controlled manner. Several such valves are shown in U.S. Patent 5,439,143 and

5,409,144 and patents related thereto. However, the silicon material can be difficult to retain in place since it is generally not possible to glue or adhere it to a surface. Further, the valve requires room to operate, which can be a problem in a youth-sized drinking cup located inside of a spout on a cap. Also, sanitation and/or replacement of non-functional valves continues to be problematic.

Accordingly, an apparatus solving the aforementioned problems is desired.

SUMMARY OF THE INVENTION

In one aspect, the present invention includes an apparatus for a drinking cup for young children having a cap adapted to cover a drinking cup, the cap having a spout and a mount, and having a valve cartridge removably attached to the mount for controlling fluid flow through the spout. The valve cartridge is removable for cleaning or replacement.

In another aspect, an apparatus includes a cap adapted to cover a drinking cup, the cap having a spout and a mount, and a valve removably attached to the mount for controlling fluid flow through the spout. The valve is made of resilient silicon rubber material and has an enlarged ring section engaging the mount to retain the valve to the mount. The valve further includes a relatively flat head section with slits therein that form a pattern of interactive valve fingers. The fingers operate in either an outflow or inflow direction to control fluid flow out of the cup or air flow into the cup. The valve still further includes a sleeve operably connecting the flat head section to the ring section, the sleeve being shaped to roll and unroll in a manner that facilitates operation of the valve fingers. The mount on the cap is configured to allow the sleeve to roll and unroll.

In another aspect, an apparatus includes a cap having a spout, a valve for controlling fluid flow to the spout, and a snap-in retainer for holding the valve in position on the cap.

In still another aspect, an apparatus includes a drinking cup and a cap for sealingly covering the drinking cup. The cap includes a spout, and a single reciprocating valve that is adapted to control fluid flow from the drinking cup to the spout and also that is adapted to control air flow through the spout back into the drinking cup. The apparatus is characterized by an absence of a separate vent or second valve in the cap and the drinking cup.

These and other features and advantages of the present invention will be further understood and appreciated by those skilled in the art by reference to the following

specification, claims, and appended drawings.

DESCRIPTION OF DRAWINGS

Fig. 1 is a perspective view of an apparatus embodying the present invention including a drinking cup and a cap;

Fig. 2 is an exploded perspective view of the apparatus of Fig. 1;

Fig. 3 is a fragmentary cross sectional view taken along the line III-III in Fig. 1;

Figs. 4 and 5 are plan and end views of the cap shown in Fig. 1;

Figs. 6-8 are cross sectional views taken along the lines VI-VI, VII-VII, and VIII-VIII in Fig. 4;

Fig. 9 is a perspective view of the valve holder shown in Fig. 2;

Figs. 10 and 11 are end and plan views of the valve holder shown in Fig. 9;

Fig. 12 is a cross sectional view taken along the line XII-XII in Fig. 11;

Fig. 13 is a perspective view of the valve retainer shown in Fig. 2;

Fig. 14 is a cross sectional view taken along the line XIV-XIV in Fig. 13;

Fig. 15 is a cross sectional view of the valve shown in Fig. 2;

Fig. 16 is a fragmentary cross sectional view showing the valve cartridge of Fig. 2 with the valve in a normally closed position;

Fig. 17 is a fragmentary cross sectional view showing the valve cartridge of Fig. 2 with the valve in a fluid-dispensing position; and

Fig. 18 is a fragmentary cross sectional view showing the valve cartridge of Fig. 2 with the valve in an air-replacing and fluid-suck-back position.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENT

For purposes of description herein, the terms "upper", "lower", "right", "left", "rear", "front", "vertical", "horizontal", and derivatives thereof shall be related to the invention as oriented in Fig. 1 as if the drinking cup were setting on a table. However, it is to be understood that the invention may assume various alternative orientations, except where expressly specified to the contrary. It is also to be understood that the specific devices and processes illustrated in the attached drawings, and described in the following specification are simply exemplary embodiments of the inventive concepts defined in the appended claims. Hence, specific dimensions and other physical characteristics relating to the embodiments disclosed herein are not to be considered as limiting, unless the claims expressly state otherwise.

An apparatus 20 (Fig. 1) embodying the present invention includes a cap 21

adapted to cover a drinking cup 22. The cap 21 has a spout 23 and a mount 24 (Fig. 3) on the underside of the cap 21 proximate but spaced from a tip of the spout 23. The mount 24 is tubular and defines a passageway to the spout 23. A valve cartridge 25 is removably pressfittingly attached to the retainer sleeve or mount 24. Specifically, the
5 valve cartridge 25 includes a valve holder 26 having a section adapted to pressfit into and frictionally engage the mount 24, a valve 27 and a valve retainer 28 that snap-attaches to the valve holder 26 to hold the valve 27 in place on the valve holder 26. It is contemplated that valve 27 can also be sonic welded or otherwise attached to mount 24. The valve 27 is made of liquid molded silicon rubber, and includes a relatively flat,
10 slightly crowned valve element or head section 29 with slits that define cooperating valve fingers or pedals 30 (Fig. 2). The valve fingers 30 cooperate to selectively allow fluid to flow out of the spout 23 or to allow air and excess fluid to flow back into the cup 22, thus allowing the valve 27 to operate as a single and only valve on the drinking cup apparatus 20.

15 The cup 22 (Fig. 2) is a standard container having an externally threaded upper end 31 for removably mounting cap 21 thereon. The cap 21 has a substantially flat top 32 with a depending collar 33. The collar 33 has an internal thread 34 adapted to threadedly engage the threaded upper end 31 of cup 22. Collar 33 (Fig. 3) includes an inner flange 35 that extends around the cap 21 concentrically with and inside of the thread
20 34. The inner flange 35 forms a recess for receiving a washer-like sealing ring 36, which ring 36 is adapted to sealingly engage an upper edge of the cup 22 to form a seal between the cap 21 and cup 22. It is noted that ring 36 could be eliminated if desired.

The top 32 of cap 21 (Fig. 4-8) has a generally circular shape in plan view, and the spout 23 projects from one side thereof upwardly. The spout 23 is formed integrally
25 with cap 21, and includes generally arcuate front and rear walls 40 and 41 that converge to an outwardly protruding tip 42 of spout 23. The illustrated tip 42 includes three spaced-apart openings 43, the size and area of which are chosen to provide adequate fluid flow to a young user. A cylindrically shaped or barrel-shaped tubular flange 44 extends downwardly from the bottom of spout 23. The lower end of flange 44 defines mount 24,
30 which is designed to closely receive and retain the valve cartridge 25.

The valve holder 26 (Figs. 9-12) of valve cartridge 25 includes a tubular section 46 and a grip or tabbed base section 47. Grip 47 includes a horizontal wall 48 and a reinforcing perpendicular web 49 having an enlarged shaped for convenient grasping. A

second reinforcing web 50 extends across an outer end of horizontal wall 48. Tubular section 46 extends perpendicularly from an apertured end of wall 48. The tube 46 forms a passageway 51 that extends through wall 48. The outside diameter and shape of tube 46 is shaped to be closely pressfittingly received in the lower end of retaining flange 44, such that frictional forces developed between the abutting surfaces of valve cartridge 25 and retaining mount 24 prevent the same from being inadvertently separated. Any fluid pressure developed in the cup during dispensing tends to further retain valve cartridge 25 in place in retainer mount 44. When cap 21 is removed from cup 22, an adult can grasp the cartridge web 49, and remove the valve cartridge 25 from retaining mount 44 for cleaning and/or replacement. The upper end of tube 46 includes a seat 52 for supporting the valve 27, and a concave ring depression 53 for receiving valve retainer 28 in a snap locked position. The valve retainer 28 (Figs. 13 and 14) includes a ring-shaped body 54 defining a hole 55, and a lip 56 to control its insertion depth. A convex ring-shaped outer surface 57 is formed on the exterior of body 54. The surface 57 is configured body 54 defining to snap into the mating concave ring depression 53. When thus engaged, the lip 56 engages an end of tube mount 24.

The valve 27 is of the type described in detail in U.S. patent 5,439,143 (to Brown et al), issued August 8, 1995, entitled DISPENSING VALVE FOR PACKAGING, and U.S. patent 5,409,144 (to Brown), issued April 25, 1995, entitled DISPENSING VALVE FOR PACKAGING. Valve 27 is a proprietary product of Liquid Molding Systems, Inc. ("LMS"), the assignee of the patents 5,439,143 and 5,409,144. A detailed discussion of the valve 27 and its operation need not be included herein for a complete understanding of the present invention, except as discussed below. The valve 27 is made of liquid molded silicon rubber, and includes an enlarged retention ring section 60, the crowned valve element section 29 that includes pedals 30, and a resilient rollable sleeve 62 connecting the ring section 60 and valve element section 29. The ring section 60 is adapted to fit between angled surfaces 63 and 64 on the opposing retaining faces of holder tube 46 and retainer body 54. The valve element 29 is slightly concavely shaped outwardly toward the tip of spout 23. Sleeve 62 also is shaped to position valve element 27 toward the tip of spout 23. Notably, the shape and concavity of valve element 29 and fingers 30, and the outward or inward shape and concavity of sleeve 62 and valve element 61 can be readily changed by redesign to provide any optimal output release pressure or inflow release pressure desired.

During use, valve 27 (Fig. 16) is positioned in valve holder tube 46 and retainer 28 is engaged therein so that the bottom edge of retainer 28 engages and holds valve 27 in valve holder 26. The valve cartridge 25 is then inserted upwardly into the bottom of mount 24 and is firmly pressfittingly positioned therein. When the user communicates a negative pressure with the open outlet at the tip of spout 23, such as by sucking or the like, the liquid beverage in cup 22 is drawn against valve 27. This causes the valve element 29 of the valve 27 to shift outwardly on its resilient rollable sleeve 62. Torque developed in the LMS valve causes the four pedals 30 formed by the cross slits to snap outwardly and open the orifice 30', so as to dispense fluid 67 freely through the spout 23 (Fig. 17). When the negative pressure drops to a predetermined level, the head portion 29 of valve 27 snaps back to close the cross-slit orifice (Fig. 16), so as to positively prevent any additional fluid from passing therethrough. Air is then drawn back through valve 27 (Fig. 18), as is necessary to equalize any pressure differential occurring in the interior of cup 22 as a consequence of dispensing liquid from the cup 21. If any liquid is trapped in the spout 23, between the open outlet 43 and valve 27, the same is drawn back into container 22 when air is sucked back into the cup 22. Where the vacuum is substantial, the returning liquid causes the head portion 29 of the valve 27 to shift inwardly on its resilient rolling sleeve 62 and then invert in the unique fashion disclosed in the LMS patents previously incorporated herein. Torque developed in the extended position of the LMS valve causes the four pedals 30 formed by the cross slits to snap outwardly and open the orifice, so as to allow fluid to flow relatively freely and quickly through the spout 23. When the negative pressure drops to a predetermined level, the head portion 29 of the valve 27 snaps back to close the cross slit orifice, and then shifts inwardly on the resilient rolling sleeve 62 so as to positively prevent any addition fluid from passing therethrough. Notably, inversion of the valve (Fig. 18) causes the valve to form a cup shaped pocket 65 to receive the fluid (Fig. 18). The particular valve construction shown can be designed to provide the particular inflow and outflow characteristics and opening pressures desired. In the event the cup 22 is inadvertently tipped over, valve 27 will prevent any of the liquid from escaping through spout 23. The reciprocating nature of valve 27 prevents leakage even when the cup 22 is dropped or otherwise jarred.

In the foregoing description, it will be readily appreciated by those skilled in the art that modifications may be made to the invention without departing from the concepts

disclosed herein. For example, it is contemplated that the valve 27 could be snap attached directly to the cap 21 without use of a cartridge holder, or that the valve 27 could be designed to be installed in an inverted, up-side-down position, or that the valve 27 could be reversible, or that a plurality of valves 27 could be provided, each having particular desired characteristics. Such modifications are to be considered as included in the following claims, unless these claims by their language expressly state otherwise.

5

The claimed invention is:

1. An apparatus for a drinking cup for young children, comprising:
a cap adapted to cover the drinking cup, the cap having a spout and a mount; and
a valve cartridge removably attached to the mount for controlling fluid flow
5 through the spout, the valve cartridge being removable for cleaning or replacement.
2. The apparatus defined in claim 1, wherein the valve cartridge includes a valve and
a valve holder.
- 10 3. The apparatus defined in claim 2, wherein the valve holder is constructed to
friction fit into the mount.
4. The apparatus defined in claim 3, wherein the valve cartridge includes a valve
retainer for engaging the valve holder to hold the valve on the valve holder.
- 15 5. The apparatus defined in claim 4, wherein the valve retainer snap attaches to the
valve holder.
6. The apparatus defined in claim 1, including a flange formed on an underside of the
20 cap that incorporates structure forming the mount.
7. The apparatus defined in claim 6, wherein the flange is cylindrically shaped.
8. The apparatus defined in claim 1, wherein the mount includes a tubular flange
25 extending from the spout downwardly and defining a passageway to the spout.
9. The apparatus defined in claim 1, wherein the valve cartridge includes a valve
having a diaphragm type valve element.
- 30 10. The apparatus defined in claim 9, wherein the valve element is made from silicon
rubber.
11. The apparatus defined in claim 10, wherein the valve element includes a head

section with slits therein forming cooperating valve fingers.

12. The apparatus defined in claim 1, wherein the valve cartridge includes a valve that is operable in both an inflow direction and an outflow direction.

5

13. The apparatus defined in claim 12, wherein the valve exhibits different release pressures in the inflow direction and the outflow direction.

14. The apparatus defined in claim 1, wherein the valve cartridge includes a valve holder having a grip to facilitate removal and installation of the valve cartridge onto the cap.

10

15. The apparatus defined in claim 1, wherein the valve cartridge includes a valve holder, a valve, and a valve retainer arranged in a sandwich-like arrangement.

15

16. The apparatus defined in claim 15, wherein the valve holder has a retainer portion for engaging the valve retainer and a handle portion to facilitate grasping and manipulating the valve cartridge.

20

17. In combination, an apparatus for young children, comprising:

a drinking cup;

a cap adapted to sealingly cover the drinking cup, the cap having a spout and a mount proximate the spout;

25

a valve removably attached to the mount for controlling fluid flow through the spout, the valve comprising resilient silicon rubber material with an enlarged ring section engaging the mount to retain the valve to the mount, a relatively flat reciprocateable head section with slits therein that form a pattern of interactive valve fingers adapted to operate in opposite directions to control fluid flow both out of the cup and air flow into the cup, and a sleeve operably connecting the head section to the ring section, the sleeve being shaped to roll and unroll in a manner that facilitates operation of the valve fingers, the mount being shaped to allow the operative movement of the head section toward and away from a tip of the spout.

30

18. The apparatus defined in claim 17, wherein the head section is crowned toward the tip of the spout.

19. The apparatus defined in claim 18, wherein the mount includes a tubular flange that defines an elongated passageway to the spout.

20. The apparatus defined in claim 19 including a valve cartridge adapted to slip fit into the tube section, the cartridge including a valve holder for releasably retaining the valve.

21. An apparatus for a drinking cup, comprising:
a cap including a spout;
a valve for controlling fluid flow to the spout; and
a snap-in retainer for holding the valve in position on the cap.

22. The apparatus defined in claim 21, wherein the valve includes a diaphragm type valve element.

23. The apparatus defined in claim 22, wherein the valve comprises silicon rubber material.

24. The apparatus defined in claim 23, wherein the valve element includes a head section with slits therein forming cooperating valve fingers.

25. The apparatus defined in claim 21, including a valve cartridge incorporating the valve and the retainer that is removably attached to the cap.

26. The apparatus defined in claim 25, wherein the valve is operable in opposing directions.

27. The apparatus defined in claim 21, wherein the cap includes a mount proximate the spout, and including a valve cartridge removably attached to the mount, the valve cartridge including a valve holder adapted to releasably receive the valve and to receive

the snap in retainer for holding the valve in position on the valve holder.

28. An apparatus comprising:

a drinking cup;

a cap for sealingly covering the drinking cup, the cap including a spout; and

a single reciprocating valve adapted to control fluid flow from the drinking cup out of the spout and also adapted to control air flow through the spout back into the drinking cup, characterized by an absence of a separate vent and absence of a second valve in the cap and the drinking cup.

29. The apparatus defined in claim 28, wherein the cap includes a mount, and including a valve cartridge removably attached to the mount, the valve cartridge including a valve holder and a valve retainer engageable with the valve holder to operably hold the valve on the cap proximate the spout.

30. The apparatus defined in claim 29, wherein the valve cartridge includes a valve that is operable in opposing directions.

31. The apparatus defined in claim 29, wherein the valve cartridge includes a valve having a diaphragm type valve element.

32. The apparatus defined in claim 28, wherein the valve is removably attached to one of the cap and the drinking cup.

33. The apparatus defined in claim 28, wherein the valve is silicon rubber.

34. An apparatus comprising:

a drinking cup defining an opening;

a cap adapted to sealingly engage the drinking cup to cover the opening, the cap

including a spout and a tube section defining a passageway leading to the spout;

a valve holder releasably attached to the tube section proximate the spout;

a two-way valve mateably engaging the valve holder and adapted to control fluid flow through the spout; and

a valve retainer snap-attached to the valve holder to sealingly hold the valve in an operative location relative to the spout.

AMENDED CLAIMS

[received by the International Bureau on 19 February 1998 (19.02.98);
original claims 1, 6-9, 14-17, 21, 22, 27-29, 31 and 34 amended; remaining claims
unchanged (5 pages)]

1. An apparatus for a drinking cup for young children, comprising:
a cap adapted to cover the drinking cup, the cap having a spout and a mounting
flange, wherein the spout defines an outlet; and
5 a valve cartridge removably attached to the mounting flange, the valve cartridge
being configured to permit simultaneous and continuous fluid flow through the spout and
outlet when a vacuum exists within the spout, wherein the valve cartridge provides the
sole opening for fluid passage through the cap when the cap is installed on a drinking
cup, and wherein the valve cartridge is removable for cleaning or replacement.
10
2. The apparatus defined in claim 1, wherein the valve cartridge includes a valve and
a valve holder.
3. The apparatus defined in claim 2, wherein the valve holder is constructed to
15 friction fit into the mount.
4. The apparatus defined in claim 3, wherein the valve cartridge includes a valve
retainer for engaging the valve holder to hold the valve on the valve holder.
- 20 5. The apparatus defined in claim 4, wherein the valve retainer snap attaches to the
valve holder.
6. The apparatus defined in claim 1, including a flange formed on an underside of the
cap that incorporates structure forming the mounting flange.
25
7. The apparatus defined in claim 6, wherein the mounting flange is cylindrically
shaped.
8. The apparatus defined in claim 1, wherein the mounting flange includes a tubular
30 portion extending from the spout downwardly and defining a passageway to the spout.
9. The apparatus defined in claim 1, wherein the valve cartridge includes a valve
having a diaphragm valve element.

10. The apparatus defined in claim 9, wherein the valve element is made from silicon rubber.

11. The apparatus defined in claim 10, wherein the valve element includes a head
5 section with slits therein forming cooperating valve fingers.

12. The apparatus defined in claim 1, wherein the valve cartridge includes a valve that is operable in both an inflow direction and an outflow direction.

10 13. The apparatus defined in claim 12, wherein the valve exhibits different release pressures in the inflow direction and the outflow direction.

14. The apparatus defined in claim 1, wherein the valve cartridge includes a valve holder having a handle portion to facilitate removal and installation of the valve cartridge
15 onto the cap.

15. The apparatus defined in claim 1, wherein the valve cartridge includes a valve holder, a valve abutting the valve holder, and a valve retainer engaging the valve cartridge and retaining the valve to the valve holder.

20 16. An apparatus for a drinking cup for young children comprising:

a cap adapted to cover the drinking cap, the cup having a spout and a mounting flange; and

a valve cartridge including a valve holder, a valve abutting the valve holder, and a
25 valve retainer engaging the valve cartridge and retaining the valve to the valve holder, wherein the valve cartridge is removably attached to the mounting flange for controlling fluid flow through the spout, the valve cartridge being removable for cleaning or replacement, and wherein the valve holder has a retainer portion for engaging the valve retainer and a handle portion to facilitate grasping and manipulating the valve cartridge.

30 17. In combination, an apparatus for young children, comprising:

a drinking cup;

a cap adapted to sealingly cover the drinking cup, the cap having a spout and a

mount proximate the spout;

a valve removably attached to the mount for controlling fluid flow through the spout, the valve comprising resilient silicon rubber material with an enlarged ring section engaging the mount to retain the valve to the mount, a relatively flat reciprocateable head section defining a marginal edge, the head section having slits therein that form a pattern of interactive valve fingers that are movable in opposite directions to control fluid flow both out of the cup and air flow into the cup, and a sleeve operably connecting the head section to the ring section, the sleeve being shaped to roll and unroll in a manner that shifts the marginal edge of the head section toward and away from a tip of the spout.

18. The apparatus defined in claim 17, wherein the head section is crowned toward the tip of the spout.

19. The apparatus defined in claim 18, wherein the mount includes a tubular flange that defines an elongated passageway to the spout.

20. The apparatus defined in claim 19 including a valve cartridge adapted to slip fit into the tube section, the cartridge including a valve holder for releasably retaining the valve.

21. An apparatus for a drinking cup, comprising:

a cap including a spout;

a valve that permits fluid flow to the spout in response to a change of pressure within the spout; and

a retainer separate from the valve and removably snap-locking the valve to the cap.

22. The apparatus defined in claim 21, wherein the valve includes a diaphragm valve element.

23. The apparatus defined in claim 22, wherein the valve comprises silicon rubber material.

24. The apparatus defined in claim 23, wherein the valve element includes a head section with slits therein forming cooperating valve fingers.

25. The apparatus defined in claim 21, including a valve cartridge incorporating the valve and the retainer that is removably attached to the cap.

26. The apparatus defined in claim 25, wherein the valve is operable in opposing directions.

27. An apparatus for a drinking cup, comprising:
a cap including a spout and a mounting flange proximate the spout;
a valve for controlling fluid flow to the spout;
a snap-in retainer holding the valve in position on the cap; and
a valve cartridge removably attached to the mounting flange, the valve cartridge including a valve holder releasably receiving the valve and receiving the snap-in retainer and holding the valve in position on the valve holder.

28. An apparatus comprising:
a drinking cup;
a cap for sealingly covering the drinking cup, the cap including a spout; and
a single reciprocating valve positioned in the spout and controlling fluid flow from the drinking cup out of the spout in response to pressure variations within the spout, and also controlling air flow through the spout back into the drinking cup, characterized by an absence of a separate vent and absence of a second valve in the cap and the drinking cup.

29. An apparatus, comprising:
a drinking cup;
a cap for sealingly covering the drinking cup, the cap including a spout and a mounting flange;
a single reciprocating valve controlling fluid flow from the drinking cup out of the spout, and also controlling air flow through the spout back into the drinking cup, characterized by an absence of a separate vent and absence of a second valve in the cap and the drinking cup; and a valve cartridge removably attached to the mounting flange,

the valve cartridge including a valve holder and a valve retainer engageable with the valve holder to operably hold the valve on the cap proximate the spout.

30. The apparatus defined in claim 29, wherein the valve cartridge includes a valve that is operable in opposing directions.

31. An apparatus comprising:

a drinking cup;

a cap for sealingly covering the drinking cup, the cap including a spout and a mounting flange, the cap further including a valve cartridge having a valve that is operable in opposing directions, the valve cartridge being removably attached to the mounting flange, the valve cartridge including a valve holder and a valve retainer engageable with the valve holder to operably hold the valve on the cap proximate the spout, and wherein the valve cartridge includes a valve having a diaphragm valve element; the valve comprising a single reciprocating valve adapted to control fluid flow from the drinking cup out of the spout and also adapted to control air flow through the spout back into the drinking cup, characterized by an absence of a separate vent and absence of a second valve in the cap and the drinking cup.

32. The apparatus defined in claim 28, wherein the valve is removably attached to one of the cap and the drinking cup.

33. The apparatus defined in claim 28, wherein the valve is silicon rubber.

34. An apparatus comprising:

a drinking cup defining an opening;

a cap adapted to sealingly engage the drinking cup to cover the opening, the cap including a spout and a tube section defining a passageway leading to the spout;

a valve holder releasably attached to the tube section proximate the spout;

a two-way valve separate from the valve holder and mateably engaging the valve holder and adapted to control fluid flow through the spout; and

a valve retainer separate from the valve holder and snap-attached to the valve holder to sealingly hold the valve in an operative location relative to the spout.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US97/18636

A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) : A47G 19/22

US CL : 220/717

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 220/717, 714, 711, 703, 229; 215/270, 311, 310, 387, 11.1, 11.4, 11.5; 222/490, 494

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 2,623,524 A (CLEMENS) 30 DECEMBER 1952, SEE ENTIRE DOCUMENT.	1,6-8
X	US 2,608,841 A (RICE) 02 SEPTEMBER 1952, SEE ENTIRE DOCUMENT.	1-4,28-30, 32
X	US 4,921,112 A (JUHLIN ET AL.) 01 MAY 1990, SEE ENTIRE DOCUMENT.	1 - 4 , 6 , 7 , 14 , 15,21,25
X — Y	US 3,085,710 A (McILROY) 16 APRIL 1963, SEE ENTIRE DOCUMENT.	28 — 33
X — Y	US 5,542,670 A (MORANO) 06 AUGUST 1996, SEE ENTIRE DOCUMENT.	1-5,9-13 — 17-26,34

☒ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:	*T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
A document defining the general state of the art which is not considered to be of particular relevance	*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
B earlier document published on or after the international filing date	*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
L document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*A* document member of the same patent family
O document referring to an oral disclosure, use, exhibition or other means	
P document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search
